<div></div> <div>Ho Chi Minh City University of Technology</div> <div>Faculty of Computer Science and Engineering</div>	FINAL EXAM	Semester/AY	1	2020-2021	
		Date		January 25 th , 2021	
	Course name	Computer Architecture			
	Course ID	CO2007			
	Duration	70 minutes	Code	201F01	

Notes:

- Write you answers right after every question;
- Students are allowed to use materials printed/written on **TWO** A4 papers (4 pages);
- All pages of this question sheet **MUST** be returned. Any missing page will let you get 0 mark!

Student's name: ANSWERS.....

Student's ID:

Learning outcomes - Questions mapping:

- L.O.1 - Estimate performance of a computer under given parameters: 1 - 5;
- L.O.2 - Explain basic instructions in the instruction sets: 6 - 15
- L.O.3 - Describe the principles and working mechanism of a processor: 16 - 29
- L.O.4 - Describe the principles and working mechanism of memory hierarchy: 30 - 40

Questions for the final test are started from here:

1. Is “throughput” or “response time” affected when more current processors are added to the system?

Answer: Throughput

2. Which factors will affect energy consumption of a computer system (given that energy consumption is a product of power consumption and execution time)?
 A - Processor architecture
 B - Cache size
 C - Clock frequency

Answer: A, B, and C

The following values are used for Question 3 to Question 5:

Assume that a program consists of 200×10^6 floating point (FP) instructions, 100×10^6 integer instructions, 80×10^6 data transfer instructions, and 40×10^6 branch instructions. CPIs of instruction types are 2, 1, 4, and 2, respectively.

3. What is average CPI of the above program?

Answer: $\approx 2.14 / \frac{15}{7}$

4. By how much must we improve the CPI of FP instructions if we want the program to run $1.5 \times$ faster?

Answer: $\text{newCPI}(\text{FP}) = 0.5$

5. How much is the execution time of the program if CPIs of integer and floating point instructions are reduced by 40% while CPIs of data transfer and branch instructions are reduced by 30%. Assume that the processor works at a 2GHz frequency.

Answer: $\approx 0.29\text{s}$

6. Which following standard instructions can be used to implement the pseudo-instruction **li** \$v0, 10 (assign an integer to a register)?
- A - **addi** \$v0, \$zero, 10
 B - **ori** \$v0, \$zero, 10
 C - **xori** \$v0, \$zero, 10

Answer: A and B

7. Assume that the register \$s0 contains 0xFFFFCA16; which instruction can be used to change this register content to 0x0000CA16?

**Answer: andi \$s0, \$s0, 0xFFFF or
 andi \$s0, \$s0, 0xCA16 or
 addiu \$s0, \$zero, 0xCA16**

8. What is the main purpose of the following sequence (the \$sp register is the stack pointer)?

```
addi $sp, $sp, -4  
sw $ra, 0($sp)
```

Answer: Push \$ra to the top of the stack

Following data is used for questions from 9 to 10:

Given the following memory locations/cells, as depicted in Figure 1, used in a standard MIPS-based system:

address:	8	9	10	11
	0x12	0x34	0x56	0x78
	0x9A	0xBC	0xDE	0xF0
address:	12	13	14	15

Figure 1: Memory map for questions from 9 to 10

Assume that the \$s0 register stores value of 8.

9. What is the value of the \$t0 register after the instruction **lb** \$t0, 6(\$s0) is executed?

Answer: 0xFFFFFDE

10. What is the value of the \$t1 register after the instruction **lui** \$t1, 4(\$s0) is executed?

Answer: Compile error

Following data is used for questions from 11 to 12:

Execute the following MIPS instructions with a MIPS processor:

```
lui $t0, 0  
ori $t0, $t0, 7  
lui $t1, 0  
ori $t1, $t1, 2  
div $t0, $t1  
mfhi $s0  
mflo $s1
```

11. What is the value of the \$s0 register?

Answer: 1

12. What is the value of the \$s1 register?

Answer: 3

Answer: 6.25

Answer: 0x414a0000

Answer: Cannot represent instructions in binary with only 32 bits

A pipeline MIPS processor consists of five stages: Instruction Decode (ID), Instruction Fetch (IF), Instruction Execution (EX), Memory Access (MEM), and Write Back (WB). Assume that the ID, EX, and MEM stages need 200 ns while the ID and WB stage require only 150 ns.

Answer: IF, ID, EX, MEM, WB

Answer: ≈ 4.50

[illegible]

Answer: 5

27. If the Forwarding technique is applied, how many cycles does the sequence need to finish?

Answer: 12

28. At cycle number 5, what are values for Forwarding units (ForwardA and ForwardB signals)?

Answer: ForwardA = 01, ForwardB = 00

29. At cycle number 5, which control signals at functional units are 0 if the Forwarding technique is applied for solving data hazards?

Answer: MemRead, MemWrite, Branch, ALUSrc, MemtoReg

The following values are used for Question 30 to Question 37:

Assume that a main memory has 32-bit byte address. A 64 KB cache consists of 4-word blocks.

30. Which is the size of the main memory?

Answer: 4GB

31. If the cache uses “direct mapped”, how many bits are the tag field?

Answer: 16

32. How many memory bits do we need to use to build in the direct mapped cache?

Answer: 593,920 or 580Kbit

33. If the cache uses “fully associative”, how many bits are the tag field?

Answer: 28

34. How many memory bits do we need to use to build the fully associative cache?

Answer: 643,072 or 628Kbit

35. If the cache uses “2-way set associative”, how many sets are there in the cache?

Answer: 2,048

36. If the cache uses “2-way set associative”, how many bits are the tag field?

Answer: 17

37. How many memory bits do we need to use to build the 4-way set associative cache?

Answer: 602,112 or 588Kbit

The following parameters are used for the tree last questions of the test:

A CPU functions at 4 GHz with a base CPI 1. Assume that the L1 cache miss rate per instruction is 2%. The accessing time of the main memory is 100 ns. The L2 cache miss rate per instruction is 0.5% while accessing time of L2 is 5ns.

38. What is the average CPI if the L2 cache is removed?

Answer: 9

39. What is the L2 miss penalty?

Answer: 400 cycles

40. What is the average CPI when both L1 and L2 are used?

Answer: 3.4

— The test consists of 40 questions printed on 6 pages —
