ReheapDown
Heap Data

Structure

Heap Algorithms

ReheapDown Build a Heap Insert a Node

Heap Applications

- L.O.4.1 List some applications of Heap.
- L.O.4.2 Depict heap structure and relate it to array.
- **L.O.4.3** List necessary methods supplied for heap structure, and describe them using pseudocode.
- L.O.4.4 Depict the working steps of methods that maintain the characteristics of heap structure for the cases of adding/removing elements to/from heap.

Outcomes

- Heap Definition
- Heap Structure

Basic Heap Algorithms ReheapUp

Heap Data

Heap Algorithms

ReheapUp ReheapDown

Build a Heap Insert a Node

Heap Applications

- **L.O.4.5** Implement heap using C/C++.
- L.O.4.6 Analyze the complexity and develop experiment (program) to evaluate methods supplied for heap structures.
- L.O.8.4 Develop recursive implementations for methods supplied for the following structures: list, tree, heap, searching, and graphs.
- L.O.1.2 Analyze algorithms and use Big-O notation to characterize the computational complexity of algorithms composed by using the following control structures: sequence, branching, and iteration (not recursion).

Definition

A heap (max-heap) is a binary tree structure with the following properties:

- 1 The tree is complete or nearly complete.
- 2 The key value of each node is greater than or equal to the key value in each of its descendents.

(Source: Data Structures - A Pseudocode Approach with C++)

Heap Data Structure

The relationship between a node and its children is fixed and can be calculated:

- \bullet For a node located at index i, its children are found at
 - Left child: 2i + 1
 Right child: 2i + 2
- 2 The parent of a node located at index i is located at $\lfloor (i-1)/2 \rfloor$.
- 3 Given the index for a left child, j, its right sibling, if any, is found at j+1. Conversely, given the index for a right child, k, its left sibling, which must exist, is found at k-1.
- 4 Given the size, N, of a complete heap, the location of the first leaf is $\lfloor N/2 \rfloor$.
- **5** Given the location of the first leaf element, the location of the last nonleaf element is 1 less.

End reheapDown

Build a Heap

- Given a filled array of elements in random order, to build the heap we need to rearrange the data so that each node in the heap is greater than its children.
- We begin by dividing the array into two parts, the left being a heap and the right being data to be inserted into the heap. Note the "wall" between the first and second parts.
- At the beginning the root (the first node) is the only node in the heap and the rest of the array are data to be inserted.
- Each iteration of the insertion algorithm uses reheap up to insert the next element into the heap and moves the wall separating the elements one position to the right.

Selection Algorithms Priority Queues

Three common applications of heaps are:

- selection algorithms,
- 2 priority queues,
- 3 and sorting.

We discuss heap sorting in Chapter 10 and selection algorithms and priority queues here.

Problem

Determining the k^{th} element in an unsorted list.

Two solutions:

- \bullet Sort the list and select the element at location k. The complexity of a simple sorting algorithm is $O(n^2)$.
- 2 Create a heap and delete k-1 elements from the heap. leaving the desired element at the top. The complexity is $O(n \log_2 n)$.

Rather than simply discarding the elements at the top of the heap, a better solution would be to place the deleted element at the end of the heap and reduce the heap size by 1.

After the k^{th} element has been processed, the temporarily removed elements can then be inserted into the heap.

Priority Queues

Priority Queues

The heap is an excellent structure to use for a priority queue.

Example

Assume that we have a priority queue with three priorities: high (3), medium (2), and low (1).

Of the first five customers who arrive, the second and the fifth are high-priority customers, the third is medium priority, and the first and the fourth are low priority.

Arrival	Priority	Priority
1	low	1999 (1 & (1000 - 1)
2	high	3998 (3 & (1000 - 2)
3	medium	2997 (2 & (1000 - 3)
4	low	1996 (1 & (1000 - 4)
5	high	3995 (3 & (1000 - 5)
