Prim's Algorithm

Course learning outcomes
Understanding of logic and discrete structures
L.O.1.1 – Describe definition of propositional and predicate logic
L.O.1.2 – Define basic discrete structures: set, mapping, graphs
Represent and model practical problems with discrete structures
L.O.2.1 – Logically describe some problems arising in Computing
L.O.2.2 – Use proving methods: direct, contrapositive, induction
L.O.2.3 – Explain problem modeling using discrete structures
Understanding of basic probability and random variables
L.O.3.1 – Define basic probability theory
L.O.3.2 – Explain discrete random variables
Compute quantities of discrete structures and probabilities
L.O.4.1 – Operate (compute/ optimize) on discrete structures
L.O.4.2 - Compute probabilities of various events, conditional
ones, Bayes theorem

### Introduction

- Very useful in computer science: search algorithm, game winning strategy, decision making, sorting, . . .
- Other disciplines: chemical compounds, family trees, organizational tree, . . .

### **Terminology**

### Definition

- parent (cha) of v is the unique u such that there is a directed edge from u to v
- when u is the parent of v, v is called a child (con) of u
- vertices with the same parent are called siblings (anh em)
- the ancestors (tổ tiên) of a vertex are the vertices in the path from the root to this vertex (excluding the vertex itself)
- descendants (con cháu) of a vertex v are those vertices that have v as an ancestor

### Spanning Trees

#### Minimum Spanning Trees

- m-ary tree ( $c\hat{a}y m$ - $ph\hat{a}n$ ): at most m children on each internal vertex of a rooted tree.
- full m-ary tree ( $c\hat{a}y m$ - $ph\hat{a}n d\hat{a}y d\hat{u}$ ): every internal vertex has exactly *m* children.
- An m-ary tree with m=2 is called a binary tree (cây nhị phân).

### **Ordered Rooted Trees**

### Definition

- An ordered rooted tree (cây có gốc có thứ tự) is a rooted tree where the children of each internal vertex are ordered (e.g. in order from left to right).
- In an ordered binary tree (cây nhị phân có thứ tự), if an
  internal vertex has two children, the first child is called the
  left child (con bên trái) and the second is called the right
  child (con bên phải).

Left subtree of a

Right subtree of a

Minimum Spanning Trees

Prim's Algorithm

Kruskal's Algorithm

### Theorem

A tree with n vertices has n-1 edges.

### Theorem

A full m-ary tree

- (i) n vertices has (n-1)/m internal vertices and [(m-1)n+1]/m leaves
- (ii) *i* internal vertices has n = mi + 1 vertices and (m 1)i + 1leaves
- (iii)  $\ell$  leaves has  $n = (m\ell 1)/(m 1)$  vertices and  $(\ell-1)/(m-1)$  internal vertices

### **Example**

### **Example (Chain Letter Game)**

- Each person who receives the letter is asked to send it on to four other peoples.
- Some peoples do this, but others do not send any letters.
- How many people have seen the letter, including the first person, if no one receives more than one letter and if the chain letter ends after there have been 100 people who read it but did not send it out?
- How many people sent out the letter?

- Each person who receives the letter is asked to send it on to four other peoples.
- Some peoples do this, but others do not send any letters.
- How many people have seen the letter, including the first person, if no one receives more than one letter and if the chain letter ends after there have been 100 people who read it but did not send it out?
- How many people sent out the letter?

**Solution** 

- Using 4-ary tree with 100 leaves corresponding to 100 persons who did not send out the letter.
- $\implies n = (ml 1)/(m 1) = (4 \times 100 1)/(4 1) = 133$  vertices and i = n l = 133 100 = 33 internal vertices.

### Level and Height

### Definition

- The level (múc) of a vertex v in a rooted tree is the length of the unique path from the root to this vertex.
- The level of the root is defined to be zero.
- The height (độ cao) of a rooted tree is the maximum of the levels of vertices (i.e. the length of the longest path from the root to any vertex).

### **Example**

- Level of root a=0, b,j,k=1 and  $c,e,f,l=2\dots$
- Because the largest level of any vertex is
   4, this tree has height
   4.

### **Labeling Ordered Rooted Trees**

- Ordered rooted trees are often used to store information.
- Need a procedure for visiting each vertex of an ordered rooted tree to access data.
- Ordering and labeling the vertices is important to traverse them in any procedure
- Universal address system (hệ địa chỉ phổ dụng)
   0 < 1 < 1.1 < 1.1.1 < 1.2 < 1.3 < ... < 2 < 3 < 3.1 < ...</li>

### Inorder Traversal (Duyệt trung thứ tự - LNR)

Suppose a tree T with root r. If T consists only of r, then r is inorder traversal of T. Otherwise, suppose r has subtrees  $T_1$ ,  $T_2$ , ...,  $T_n$  from left to right, inorder traversal:  $T_1 \to r \to T_2 \to \ldots \to T_n$ .

Minimum Spanning Trees

$$(\neg(p \land q) \lor (\neg q \land r)) \to (\neg p \lor \neg r)$$

Then use this rooted tree to find the prefix, postfix and infix forms of this expression

### Solution

- Constructing the rooted tree from the bottom up
- Preorder traversal creates prefix notation  $\rightarrow \lor \neg \land p \ q \land \neg q \ r \lor \neg p \ \neg r$
- Postorder traversal creates postfix notation  $p \ q \land \neg \lor q \neg r \land p \neg r \neg \lor \rightarrow$
- Inorder traversal creates infix notation (with parentheses)  $p \ q \neg \lor q \neg \land r \rightarrow p \neg \lor r \neg$

### **Binary Search Trees**

### Definition

Binary search tree (cây tìm kiếm nhị phân - BST) is a binary tree in which the assigned key of a vertex is:

- larger than the keys of all vertices in its left subtree, and
- smaller than the keys of all vertices in its right subtree.

Spanning Trees

Minimum Spanning Trees Prim's Algorithm

# Example

There are seven coins, all with the same weight, and a counterfeit coin that weighs less than the others. How many weighings are necessary using a balance scale to determine which of the eight coins is the counterfeit one? Give an algorithm for finding this counterfeit coin.

Minimum Spanning Trees Prim's Algorithm

# **Example**

If we know that the probability that a person has tuberculosis (TB) is p(TB) = 0.0005.

We also know p(+|TB) = 0.999 and  $p(-|\overline{TB}) = 0.99$ .

What is p(TB|+) and  $p(\overline{TB}|-)$ ?

Prim's Algorithm

B) 10

# Gọi T là cây bao trùm của đồ thị đầy đủ $K_6$ . Số lượng cạnh của

 $G \cup G^c = K_n$  và  $E \cap F = \emptyset$ .

Cho G = (V, E) là một đồ thi đơn và vô hướng bất kỳ, có n đỉnh. Đinh nghĩa đồ thị bù của G là  $G^c = (V, F)$  thỏa hai tính chất:

đồ thi bù  $T^c$  là A) 5

C) 15

D) 20
